System Diagram

Product Highlights

1. Provide users with more encryption algorithms, which are candidates for SHA3 in the last round, to choose when using JCrypTool.
2. Design a better dialog box for users to choose different algorithms and read the output more easily.
3. Visualized Blake algorithm.

Demonstration

Problem with Algorithms

The algorithm doesn't output the correct answer.

Test case(for Groestl):

1. Abcd: D8CD6BE396A8F029BC46E48367D3D84150776C10B7A6AFFEDB19E8D0D175A708
2. Aefg: D8CD6BE396A8F029BC46E48367D3D84150776C10B7A6AFFEDB19E8D0D175A708

Problem 1: Unless we change the first character of the input, the output will be the same.

Problem 2: Unless we change the length of the input, the output will be the same for most cases.

Problem solved:

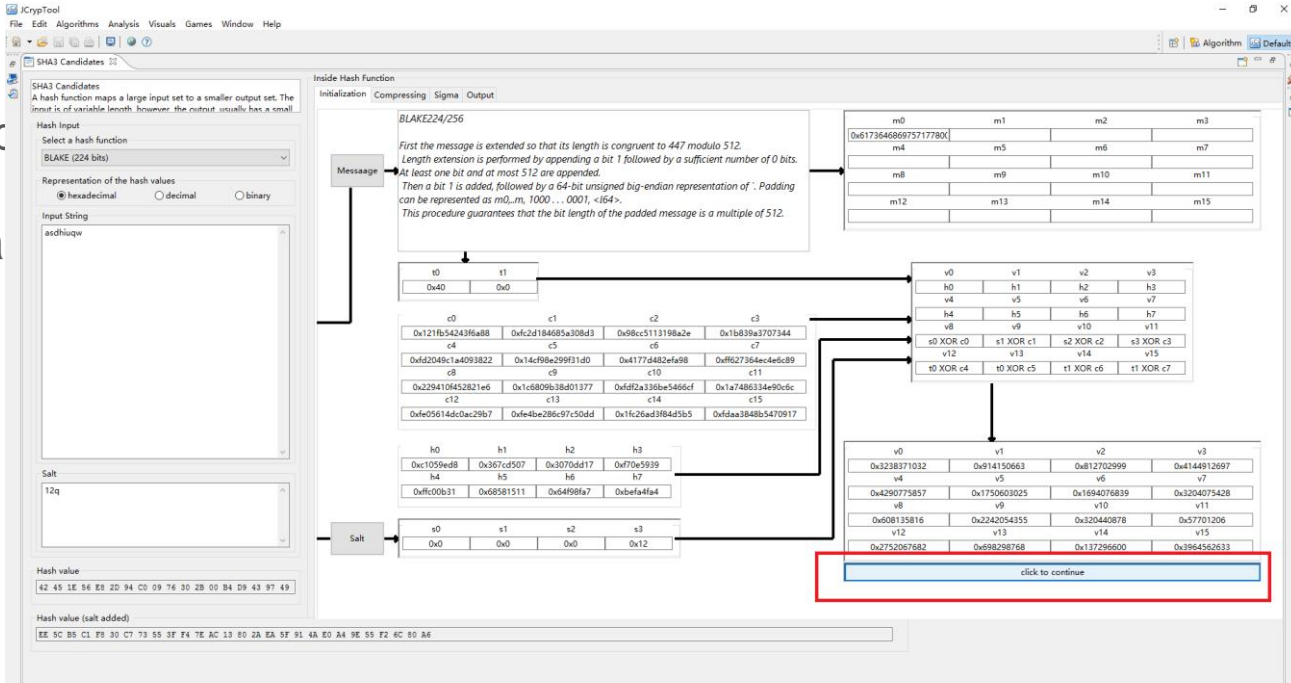

1. Abcd: 4A639E2F274A8B6A4D3AC957456F8FAE8DF80E2AEA89C19276BDACA5586B5F99
2. Aefg: EDFF182DB0D66874D155CA79CD37FF3F625C822B37AE66E3C1903D50AB5C6C3A

Problem with Visualization

Visualization cannot jump automatically when clicking at the button.

Solved: Inp

Trello

The screenshot displays the Trello web interface for a project board titled "Cryptology Project". The board is organized into five columns: "To Do", "Doing", "Done", "Helpful Hints", and "Needs Help".

- To Do:** Contains a card titled "Test Keccak" with a description: "Check and package all code together and send it to JCrypTool and push the code to JCrypTool's Github master branch." It has three assignees (DF, MK, WZ) and an "Add a card..." button at the bottom.
- Doing:** Contains a card titled "Implement Keccak" with an assignee (MK) and an "Add a card..." button at the bottom.
- Done:** Contains several cards:
 - "Modify the visualization, sending alert when input wrong data" (assignee: WZ)
 - "Test algorithms, dialog box and visualization" (assignees: DF, MK, WZ)
 - "Visualization for Blake" (assignee: WZ)
 - "Modifying Blake algorithm" (assignee: DF)
 - "Modifying Groestl algorithm." (assignee: WZ)
 - "Add Help Text about BLAKE and Groestl" (assignee: WZ)
 - "Research digital signatures based on cryptographic hash functions" (assignee: DF, due date: Sep 28, 2 days)
 - "Create a document to describe all of the useful files in the existing jcryptool package that we will be expected to edit/emulate in our algorithm." (assignee: MK, due date: Oct 5)
 - "Explore existing SHA3 candidates on JCrypTool software" (assignee: MK)
- Helpful Hints:** Contains text-based cards:
 - "To get to existing SHA3: Crypto -> Working Tree -> org.jcryptool.crypto.modern.sha3 -> src -> keep clicking folders until you click to sha3 folder."
 - "Documentation Website: <https://github.com/jcryptool/core/wiki/Documentation>"
 - "Check Weichao Zhou branch in our github. It helps you to add the visual plug-in to JCrypTool and implement it in Visual menu."
 - "If you add a new plug-in and it isn't showing up when you run JCrypTool, check your run configurations in Eclipse, under the Plug-ins tab. Make sure the 'Add new workspace plug-ins to this launch configuration automatically' is checked, or go through the list and manually select the plug-in you just added."
- Needs Help:** Empty column with an "Add a card..." button.
- Sprint 2:** Empty column with an "Add a card..." button.

On the right side, there is a "Menu" panel with options like "Add Members...", "Change Background", "Filter Cards", "Power-Ups", "Stickers", and "More". Below the menu is an "Activity" section showing a list of recent actions, such as "lostforest moved Modify the visualization, sending alert when input wrong data from Doing to Done" and "lostforest added Weichao Zhou to Modify the visualization, sending alert when input wrong data".

The bottom of the image shows a Windows taskbar with various application icons and the system clock indicating the date 2016/12/11 and time 17:32.

Test Case 1

1. Different input with same length with 256 hash bit length.

Input1: ABCDefgh

Input2: ABCDijkl

Groestl:

Output1:

AA7FF5E8167C47B451C75852A2CF77362708F9D9C15CE349E26D81FB8266B085

Output2:

CE4D4AE59B17F7441F638E519D8A24BE737CDAF9E6A944BF7BF4A609E184A7BF

Blake:

Output1:

E6A2B048BAB77FC6798346A34FE91635507DFABF21CF904D63DD12933675C6DB

Output2:

0FFFB62363102F94C5FA4791F565CA93FAD8BE51EC2067E16F2BED91310E8C7B

Test Case 2

2. Different input with only ONE character different

Input1: uihkjllihjkl1oiuhjnkml7liu

Input2: uihkjllihjkd1oiuhjnkml7liu

Groestl:

Output1:

EE2BE9B9D85A5F72C11AA258742E1B7E8742C1395966B4CF9D5F66F7780AFA79

Output2:

99FDA91895657FFE1D19F4821945D5750CB9C8F19065F2E413D2EF7A1B904AD4

Blake:

Output1:

C054E0ECCC6AD3DE0E539B9F04904C07B6B75ABF528E7A2644F790C4D67B5447

Output2:

42632FE4B23C9C8DCB2C40503D16674EC315DA0BD5EFB1180A985D86D282DF79

Top three things that worked well

1. Algorithm implementation for SHA3 candidates.
2. Design the dialog box.
3. Visualized the Blake algorithm.

Top three things that we have learned

1. Learn how to develop a plugin based on a project.
2. Java knowledge, especially the basic Java data structure.
3. Learn how to use Github, Trello and Slack.

Future plan

1. Implement SHA3 candidates left.
2. Build more visualization for SHA3 candidates.
3. Implement the visualization by import the package other than have a copy for the visualization
4. Check and package all code together and send it to JCrypTool and push the code to JCrypTool's Github master branch.

Thank You
